Opera firmware

Author: Marco Gittler <g.marco@freenet.de>

To extract the firmware for the Opera DVB-S1 USB-Box you need to copy the files:

2830SCap2.sys 2830SLoad2.sys

from the windriver disk into this directory.

Then run:

> **System Message: WARNING/2** (`D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\admin-guide\media\[linux-master][Documentation][admin-guide][media]opera-firmware.rst, line 18`)
>
> Cannot analyze code. No Pygments lexer found for "none".
>
> ```
> .. code-block:: none
>
>         scripts/get_dvb_firmware opera1
> ```

and after that you have 2 files:

dvb-usb-opera-01.fw dvb-usb-opera1-fpga-01.fw

in here.

Copy them into /lib/firmware/ .

After that the driver can load the firmware (if you have enabled firmware loading in kernel config and have hotplug running).
