Explanation of files in this directory

`rsa-private-jwkset.json` , `rsa-public-jwkset.json` , `hmac-jwkset.json`

These files are created by running the tests in `JwtRealmGenerateTests` .

Those tests generate the yaml settings, the keystore settings and the JWK Sets for each sample reaml

Copy the output from the test output into the applicable file (you may wish to run it through `jq` first in order to make it more readable).

If additional keys are needed (e.g. to add more algorithms / key sizes) we can either extend the existing JWKSets with another set of keys (that is, modify the existing method in `JwtRealmGenerateTests` so that it creates more keys in the same JWKSet, then re-run and replace the files on disk) or create new files (that is, add another test to `JwtRealmGenerateTests` that creates the relevant realm and/or JWKSet, then re-run and add the new files to disk).
