First blog post on the newly launched blog! It even has its own [RSS feed](#) for those who still use that. This blog will be more frequently updated than the [newsletter](#), so you can subscribe to either or both, as they will be used for different purposes.

Columns on mobile too

By default, columns are only activated on **tablet** and **desktop**. If you want to use columns on mobile *too*, add the `is-mobile` modifier on the `columns` container.

{% highlight html %}

{% endhighlight %}

Responsive columns

You can now apply different **column size** for each **breakpoint**.

For example, let's say you want a column to take half the width on mobile, a third on tablet, and a quarter on desktop:

`is-half-mobile`

`is-one-third-tablet`

`is-one-quarter-desktop`

{% highlight html %}

{% endhighlight %}
Info
If you use **mobile** modifiers on single `column` elements, make sure to use the `is-mobile` modifier on the `columns` container.

Multiline columns

By default, if you want to start a new **row**, you just need to close a `columns` container and open a new one.

But you can also add the `is-multiline` **modifier** on the `columns` container, and use **column size** modifiers (like `is-half` or `is-3`) to define size on multiple rows within the *same* container.

`is-one-quarter`

`is-one-quarter`

`is-one-quarter`

`is-one-quarter`

`is-half`

`is-one-quarter`

`is-one-quarter`

`is-one-quarter`

Auto

Helpers section

While modifiers are specific to each Bulma element, **helpers** are general utility classes that can be applied on almost *any* element. Check out the new [helpers documentation](#)!
