HTTPRequest.failure() method

Access information about the request's failure.

Signature:

```
failure(): {
        errorText: string;
    } | null;
```

Returns:

{ errorText: string; } | null

`null` unless the request failed. If the request fails this can return an object with `errorText` containing a human-readable error message, e.g. `net::ERR_FAILED`. It is not guaranteed that there will be failure text if the request fails.

Remarks

Example

Example of logging all failed requests:

```
page.on('requestfailed', request => {
  console.log(request.url() + ' ' + request.failure().errorText);
});
```
