Frame.select() method

Triggers a `change` and `input` event once all the provided options have been selected.

Signature:

```
select(selector: string, ...values: string[]): Promise<string[]>;
```

Parameters

Parameter	Type	Description
selector	string	a selector to query the frame for
values	string[]	an array of values to select. If the `<select>` has the `multiple` attribute, all values are considered, otherwise only the first one is taken into account.

Returns:

Promise<string[]>

the list of values that were successfully selected.

Remarks

If there's no `<select>` element matching `selector`, the method throws an error.

Example

```
frame.select('select#colors', 'blue'); // single selection
frame.select('select#colors', 'red', 'green', 'blue'); // multiple selections
```
