Slot fallbacks

A component can specify *fallbacks* for any slots that are left empty, by putting content inside the `<slot>` element:

```
<div class="box">
    <slot>
        <em>no content was provided</em>
    </slot>
</div>
```

We can now create instances of `<Box>` without any children:

```
<Box>
    <h2>Hello!</h2>
    <p>This is a box. It can contain anything.</p>
</Box>

<Box/>
```
