reactive-dict

Source code of released version | Source code of development version ***

This package provide `ReactiveDict`, a general-purpose reactive datatype for use with tracker. It provides all of the functionality of the `Session` object documented in the main Meteor docs, such as reactive `get`, `set`, and `equals` functions.

If you provide a name to its constructor, its contents will be saved across Hot Code Push client code updates.

Example usage:

```javascript
var dict = new ReactiveDict('myDict');
dict.set("weather", "cloudy");
Tracker.autorun(function () { console.log("now " + dict.get("weather")); });
// now cloudy
dict.set("weather", "sunny");
// now sunny
```

For more information, see the Tracker project page.

Future work

Unify with reactive-var.
