Setup transformers following instructions in README.md, (I would fork first).

```
git clone git@github.com:huggingface/transformers.git
cd transformers
pip install -e .
pip install pandas GitPython wget
```

Get required metadata

```
curl https://cdn-datasets.huggingface.co/language_codes/language-codes-3b2.csv  > language-c
curl https://cdn-datasets.huggingface.co/language_codes/iso-639-3.csv > iso-639-3.csv
```

Install Tatoeba-Challenge repo inside transformers

```
git clone git@github.com:Helsinki-NLP/Tatoeba-Challenge.git
```

To convert a few models, call the conversion script from command line:

```
python src/transformers/models/marian/convert_marian_tatoeba_to_pytorch.py --models heb-eng
```

To convert lots of models you can pass your list of Tatoeba model names to
`resolver.convert_models` in a python client or script.

```
from transformers.convert_marian_tatoeba_to_pytorch import TatoebaConverter
resolver = TatoebaConverter(save_dir='converted')
resolver.convert_models(['heb-eng', 'eng-heb'])
```

Upload converted models

Since version v3.5.0, the model sharing workflow is switched to git-based system
. Refer to model sharing doc for more details.

To upload all converted models,

1. Install git-lfs.

2. Login to `transformers-cli`

```
transformers-cli login
```

3. Run the `upload_models` script

```
./scripts/tatoeba/upload_models.sh
```

Modifications

- To change naming logic, change the code near `os.rename`. The model card
  creation code may also need to change.
- To change model card content, you must modify `TatoebaCodeResolver.write_model_card`
