Select multiple

A select can have a `multiple` attribute, in which case it will populate an array rather than selecting a single value.

Returning to our earlier ice cream example, we can replace the checkboxes with a `<select multiple>`:

```
<h2>Flavours</h2>

<select multiple bind:value={flavours}>
    {#each menu as flavour}
        <option value={flavour}>
            {flavour}
        </option>
    {/each}
</select>
```

> Press and hold the `control` key (or the `command` key on MacOS) for selecting multiple options.
