Alert

Displays important alert messages.

Basic usage

Alert components are non-overlay elements in the page that does not disappear automatically.

:::demo Alert provides 4 types of themes defined by `type`, whose default value is `info`.

```
<template>
  <el-alert
    title="success alert"
    type="success">
  </el-alert>
  <el-alert
    title="info alert"
    type="info">
  </el-alert>
  <el-alert
    title="warning alert"
    type="warning">
  </el-alert>
  <el-alert
    title="error alert"
    type="error">
  </el-alert>
</template>
```

:::

Theme

Alert provide two different themes, `light` and `dark`.

:::demo Set `effect` to change theme, default is `light`.

```
<template>
  <el-alert
    title="success alert"
    type="success"
    effect="dark">
  </el-alert>
  <el-alert
    title="info alert"
    type="info"
    effect="dark">
  </el-alert>
  <el-alert
    title="warning alert"
    type="warning"
    effect="dark">
```

```
    </el-alert>
    <el-alert
      title="error alert"
      type="error"
      effect="dark">
    </el-alert>
  </template>
```

:::

Customizable close button

Customize the close button as texts or other symbols.

:::demo Alert allows you to configure if it's closable. The close button text and closing callbacks are also customizable. `closable` attribute decides if the component can be closed or not. It accepts `boolean` , and the default is `true` . You can set `close-text` attribute to replace the default cross symbol as the close button. Be careful that `close-text` must be a string. `close` event fires when the component is closed.

```
<template>
  <el-alert
    title="unclosable alert"
    type="success"
    :closable="false">
  </el-alert>
  <el-alert
    title="customized close-text"
    type="info"
    close-text="Gotcha">
  </el-alert>
  <el-alert
    title="alert with callback"
    type="warning"
    @close="hello">
  </el-alert>
</template>

<script>
  export default {
    methods: {
      hello() {
        alert('Hello World!');
      }
    }
  }
</script>
```

:::

With icon

Displaying an icon improves readability.

:::demo Setting the `show-icon` attribute displays an icon that corresponds with the current Alert type.

```
<template>
  <el-alert
    title="success alert"
    type="success"
    show-icon>
  </el-alert>
  <el-alert
    title="info alert"
    type="info"
    show-icon>
  </el-alert>
  <el-alert
    title="warning alert"
    type="warning"
    show-icon>
  </el-alert>
  <el-alert
    title="error alert"
    type="error"
    show-icon>
  </el-alert>
</template>
```

:::

Centered text

Use the `center` attribute to center the text.

:::demo

```
<template>
  <el-alert
    title="success alert"
    type="success"
    center
    show-icon>
  </el-alert>
  <el-alert
    title="info alert"
    type="info"
    center
    show-icon>
  </el-alert>
  <el-alert
    title="warning alert"
    type="warning"
    center
    show-icon>
```

```
      </el-alert>
      <el-alert
        title="error alert"
        type="error"
        center
        show-icon>
      </el-alert>
    </template>
```

:::

With description

Description includes a message with more detailed information.

:::demo Besides the required `title` attribute, you can add a `description` attribute to help you describe the alert with more details. Description can only store text string, and it will word wrap automatically.

```
    <template>
      <el-alert
        title="with description"
        type="success"
        description="This is a description.">
      </el-alert>
    </template>
```

:::

With icon and description

:::demo At last, this is an example with both icon and description.

```
    <template>
      <el-alert
        title="success alert"
        type="success"
        description="more text description"
        show-icon>
      </el-alert>
      <el-alert
        title="info alert"
        type="info"
        description="more text description"
        show-icon>
      </el-alert>
      <el-alert
        title="warning alert"
        type="warning"
        description="more text description"
        show-icon>
      </el-alert>
      <el-alert
```

```
      title="error alert"
      type="error"
      description="more text description"
      show-icon>
  </el-alert>
</template>
```
