Apollo Server and Client Example

Apollo is a GraphQL client that allows you to easily query the exact data you need from a GraphQL server. In addition to fetching and mutating data, Apollo analyzes your queries and their results to construct a client-side cache of your data, which is kept up to date as further queries and mutations are run.

In this simple example, we integrate Apollo seamlessly with Next.js data fetching methods to fetch queries in the server and hydrate them in the browser.

Deploy your own

Deploy the example using Vercel or preview live with StackBlitz

▲ Deploy

How to use

Execute `create-next-app` with npm or Yarn to bootstrap the example:

```
npx create-next-app --example api-routes-apollo-server-and-client api-routes-apollo-
server-and-client-app
# or
yarn create next-app --example api-routes-apollo-server-and-client api-routes-
apollo-server-and-client-app
# or
pnpm create next-app -- --example api-routes-apollo-server-and-client api-routes-
apollo-server-and-client-app
```

Deploy it to the cloud with Vercel (Documentation).
