使用 `dateRender` 可以自定义日期单元格的内容和样式。

en-US

We can customize the rendering of date cells in the calendar by providing a `dateRender` function to `DatePicker`.

```jsx
import { DatePicker, Space } from 'antd';

const { RangePicker } = DatePicker;

export default () => (
  <Space direction="vertical" size={12}>
    <DatePicker
      dateRender={current => {
        const style = {};
        if (current.date() === 1) {
          style.border = '1px solid #1890ff';
          style.borderRadius = '50%';
        }
        return (
          <div className="ant-picker-cell-inner" style={style}>
            {current.date()}
          </div>
        );
      }}
    />
    <RangePicker
      dateRender={current => {
        const style = {};
        if (current.date() === 1) {
          style.border = '1px solid #1890ff';
          style.borderRadius = '50%';
        }
        return (
          <div className="ant-picker-cell-inner" style={style}>
            {current.date()}
          </div>
        );
      }}
    />
  </Space>
);
```
