rake-fast

Fast rake autocompletion plugin.

This plugin caches the output for later usage and significantly speeds it up. It generates a `.rake_tasks` cache file in parallel to the Rakefile. It also checks the file modification time to see if it needs to regenerate the cache file.

This is entirely based on [this pull request by Ullrich Schäfer](#), which is inspired by [this Ruby on Rails trick from 2006](#).

Think about that. 2006.

Since August of 2016, it also checks if it's in a Rails project and looks at rake files inside `lib/tasks` and their modification time to know if the cache file needs to be regenerated.

Installation

Just add the plugin to your `.zshrc`:

```
plugins=(... rake-fast)
```

You might consider adding `.rake_tasks` to your [global .gitignore](#)

Usage

Type `rake`, then press tab.

If you want to force the regeneration of the `.rake_tasks` file, run `rake_refresh`.
