Gradle plugin

This plugin adds completions and aliases for [Gradle](.).

To use it, add `gradle` to the plugins array in your zshrc file:

```
plugins=(... gradle)
```

Usage

This plugin creates a function called `gradle-or-gradlew`, which is aliased to `gradle`, which is used to determine whether the current project directory has a gradlew file. If `gradlew` is present it will be used, otherwise `gradle` is used instead. Gradle tasks can be executed directly without regard for whether it is `gradle` or `gradlew`. It also supports being called from any directory inside the root project directory.

Examples:

```
gradle test
gradle build
```

Completion

This plugin uses [the completion from the Gradle project](.), which is distributed under the MIT license.
