In the DOM, everything is a string. That's unhelpful when you're dealing with numeric inputs — `type="number"` and `type="range"` — as it means you have to remember to coerce `input.value` before using it.

With `bind:value`, Svelte takes care of it for you:

```
<input type=number bind:value={a} min=0 max=10>
<input type=range bind:value={a} min=0 max=10>
```
