gcloud

This plugin provides completion support for the [Google Cloud SDK CLI](#).

To use it, add `gcloud` to the plugins array in your zshrc file.

```
plugins=(... gcloud)
```

It relies on you having installed the SDK using one of the supported options listed [here](#).

Plugin Options

- Set `CLOUDSDK_HOME` in your `zshrc` file before you load oh-my-zsh if you have your GCloud SDK installed in a non-standard location. The plugin will use this as the base for your SDK if it finds it set already.

- If you do not have a `python2` in your `PATH` you'll also need to set the `CLOUDSDK_PYTHON` environment variable at the end of your `.zshrc`. This is used by the SDK to call a compatible interpreter when you run one of the SDK commands.
