fastclick

> **Warning:** *As of late 2015 most mobile browsers - notably Chrome and Safari - no longer have a 300ms touch delay, so fastclick offers no benefit on newer browsers, and risks introducing [bugs](#) into your application. Consider carefully whether you really need to use it.*

FastClick is a simple, easy-to-use library for eliminating the 300ms delay between a physical tap and the firing of a `click` event on mobile browsers. The aim is to make your application feel less laggy and more responsive while avoiding any interference with your current logic.

FastClick is developed by [FT Labs](#), part of the Financial Times.

For more info see the original repo: [ftlabs/fastclick](#).

This package is included by default on all Meteor Phonegap/Cordova apps. If you would like to use Fastclick for mobile web as well, add it to your app directly with `meteor add fastclick`.

In case you want to disable FastClick for certain elements, you can add the `needsclick` class as described in the [advanced section](#) of the FastClick documentation:

```html
<a class="needsclick">Ignored by FastClick</a>
```
