brew plugin

The plugin adds several aliases for common [brew](#) commands.

To use it, add `brew` to the plugins array of your zshrc file:

```
plugins=(... brew)
```

Aliases

Alias	Command	Description
brewp	brew pin	Pin a specified formula so that it's not upgraded.
brews	brew list -1	List installed formulae or the installed files for a given formula.
brewsp	brew list --pinned	List pinned formulae, or show the version of a given formula.
bubo	brew update && brew outdated	Update Homebrew data, then list outdated formulae and casks.
bubc	brew upgrade && brew cleanup	Upgrade outdated formulae and casks, then run cleanup.
bubu	bubo && bubc	Do the last two operations above.
buf	brew upgrade --formula	Upgrade only formulas (not casks).
bcubo	brew update && brew outdated --cask	Update Homebrew data, then list outdated casks.
bcubc	brew upgrade --cask && brew cleanup	Update outdated casks, then run cleanup.

Completion

With the release of Homebrew 1.0, they decided to bundle the zsh completion as part of the brew installation, so we no longer ship it with the brew plugin; now it only has brew aliases. If you find that brew completion no longer works, make sure you have your Homebrew installation fully up to date.
