Creating and symbolicating local crash reports

VSCode since version 1.46 now supports a new `--crash-reporter-directory` `<absolute-path>` option that you can use to produce crash dumps into that folder. Please try this option first: * close all instances of VSCode * run `code --crash-reporter-directory <absolute-path>` from the command line * note: use `code-insiders` for the insiders version if you are using it * take the steps that lead to the crash * check for a `*.dmp` file in that folder * send the `*.dmp` file back to us (email, or attach to issue)

If you can reproduce the issue running out of sources: * Follow the instructions at https://github.com/nornagon/electron-minidump/blob/master/README.md * Check for the symbolicated trace
