Statements

We're not limited to declaring reactive *values* — we can also run arbitrary *statements* reactively. For example, we can log the value of `count` whenever it changes:

```
$: console.log('the count is ' + count);
```

You can easily group statements together with a block:

```
$: {
    console.log('the count is ' + count);
    alert('I SAID THE COUNT IS ' + count);
}
```

You can even put the `$:` in front of things like `if` blocks:

```
$: if (count >= 10) {
    alert('count is dangerously high!');
    count = 9;
}
```
