Anything exported from a `context="module"` script block becomes an export from the module itself. If we export a `stopAll` function from `AudioPlayer.svelte` …

```
<script context="module">
    const elements = new Set();

    export function stopAll() {
        elements.forEach(element => {
            element.pause();
        });
    }
</script>
```

…we can then import it in `App.svelte` …

```
<script>
    import AudioPlayer, { stopAll } from './AudioPlayer.svelte';
</script>
```

…and use it in an event handler:

```
<button on:click={stopAll}>
    stop all audio
</button>
```

> *You can't have a default export, because the component is the default export.*
