Class: TouchBarLabel

Create a label in the touch bar for native macOS applications

Process: Main *This class is not exported from the `'electron'` module. It is only available as a return value of other methods in the Electron API.*

new TouchBarLabel(options)

- `options` Object
  - `label` string (optional) - Text to display.
  - `accessibilityLabel` string (optional) - A short description of the button for use by screenreaders like VoiceOver.
  - `textColor` string (optional) - Hex color of text, i.e `#ABCDEF`.

When defining `accessibilityLabel`, ensure you have considered macOS best practices.

Instance Properties

The following properties are available on instances of `TouchBarLabel`:

touchBarLabel.label   A `string` representing the label's current text. Changing this value immediately updates the label in the touch bar.

touchBarLabel.accessibilityLabel   A `string` representing the description of the label to be read by a screen reader.

touchBarLabel.textColor   A `string` hex code representing the label's current text color. Changing this value immediately updates the label in the touch bar.
