SVG components example

This example uses a custom `.babelrc` to add support for importing `.svg` files and rendering them as React components. [babel-plugin-inline-react-svg](#) is used to handle transpiling the SVGs.

Deploy your own

Deploy the example using [Vercel](#) or preview live with [StackBlitz](#)

[▲ Deploy](#)

How to use

Execute [`create-next-app`](#) with [npm](#) or [Yarn](#) to bootstrap the example:

```
npx create-next-app --example svg-components svg-components-app
# or
yarn create next-app --example svg-components svg-components-app
# or
pnpm create next-app -- --example svg-components svg-components-app
```

Deploy it to the cloud with [Vercel](#) ([Documentation](#)).
