We can make more appealing user interfaces by gracefully transitioning elements into and out of the DOM. Svelte makes this very easy with the `transition` directive.

First, import the `fade` function from `svelte/transition` …

```
<script>
    import { fade } from 'svelte/transition';
    let visible = true;
</script>
```

…then add it to the `<p>` element:

```
<p transition:fade>Fades in and out</p>
```
