> *Note: This package has been deprecated.*

This package lets you use Markdown in your templates.

Installation

```
meteor add markdown
```

Usage

This package is lazy loaded. Is is not added into the initial Bundle. So you need to import it in your template.

```
// myTemplate.js
import 'meteor/markdown';
```

Then just put your markdown inside `{% raw %}{{#markdown}} ... {{/markdown}}{% endraw %}` tags.
You can still use all of the usual Meteor template features inside a Markdown block, such as `{% raw %}{{#each}} {% endraw %}`, and you still get reactivity.

Example:

```
<!-- myTemplate.html -->
{{#markdown}}I am using __markdown__.{{/markdown}}
```

outputs

```
<p>I am using <strong>markdown</strong>.</p>
```
